The Federal, States, County and Cities governments manage a vast array of facilities that include buildings, parks, roadways, transportation systems, vehicles and the list goes on. All these facilities are maintained by skilled personnel that monitor, inspect, and maintain these government assets. In the past, the tracking of these activities were recorded on paper forms and sent to administrators to update central records. Mobile computers are now replacing these paper forms which increase field worker productivity, reduce errors and provide central reports for tracking trends in the system. Field workers often can perform one more inspection or service per day with the use of mobile computer based system than the previous paper form systems.

Safety Inspection & Management:

Mobile inspection and management systems provide cloud-based safety and inspection software. Safety managers and professionals around the world use these systems on the web, smartphones and tablets to help increase safety and compliance, improve efficiency and eliminate tedious paperwork and data entry tasks.

Remote Monitoring:

Remote Monitoring systems provide a complete m2m remote management solution that enables you to monitor, control and supervise the performance and operation of remote equipment and installations via Ethernet, GSM, GPRS or 3G/4G networks. These systems cover complete end-to-end solutions for power generators, renewable energy, telecom base stations, tank monitoring, building and HVAC, industrial automation and much more. Remote Monitoring systems consist of 3 main elements: web management console, remote access and configuration features.

Benefits & Features:

- Increase productivity by reducing time spent on safety and compliance tasks.
- Access safety data anywhere, anytime on the web, smartphones and tablets without IT hassles.

- Get live, personalized training and support for the cloud-based safety management system.
- Get instant access to equipment status and alarms to keep track of units to protect from theft.

- Manage energy consumption to increase lifetime of batteries by staying on top of temperatures
- Reduce on-site visits and ensure that equipment starts when needed
